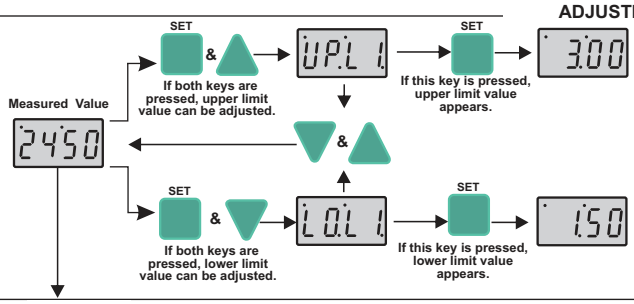
EPA241 PROGRAMMING DIAGRAM

Increment key — Used for increasing the setpoint value and changing parameters.
When held down for a few seconds, configured numeric value increases faster.

Decrement key — Used for decreasing the setpoint value and changing parameter.
When held down for a few seconds, configured numeric value decreases faster.

Programming key — Used for displaying and configuring the selected parameter value.

ADJUSTING THE ALARM VALUE

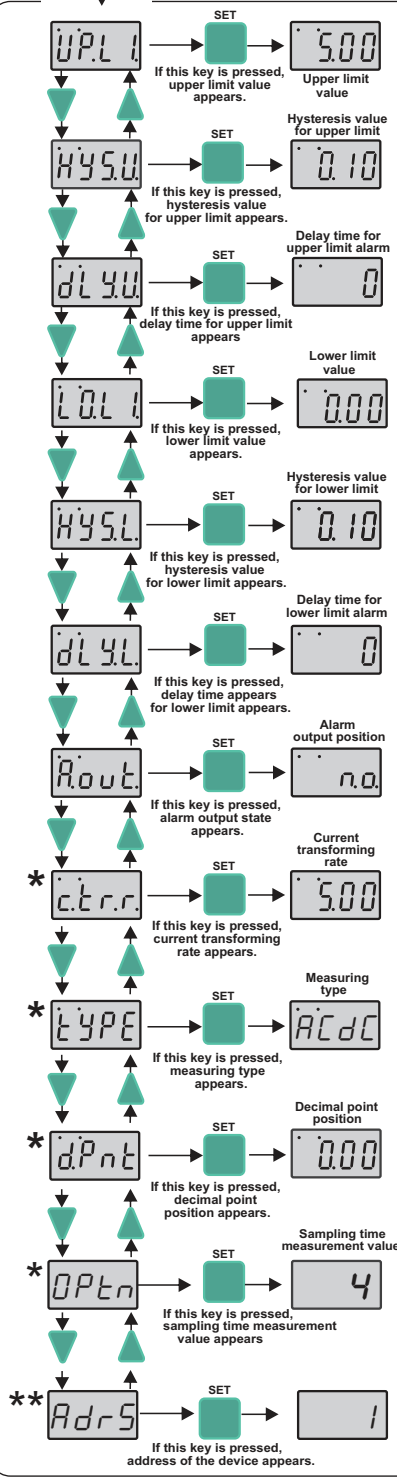


By using ▼ and ▲ keys, upper limit value can be adjusted between lower scale and upper scale that is specified with ctrr parameter.This parameter can't be lower than (LoL 1 + HYSL + HYSU) value.

By using ▼ and ▲ keys, lower limit value can be adjusted between lower scale and upper scale that specified with ctrr parameter.This parameter can't be higher than (UPL 1 - HYSU - HYSL) value.

If both ▲ & ▼ keys are pressed and held for 3 seconds,programming mode is entered.If ▼ & ▲ keys are pressed while parameter names are displayed,then it returns to measured value mode.

PROGRAMMING MODE



By using ▼ and ▲ keys, upper limit value can be adjusted between minimum and maximum scale that is specified with ctrr parameter.This parameter can't be lower than (LoL 1 + HYSL + HYSU) value.

If SET key is pressed, it returns to parameter name.

By using ▼ and ▲ keys, hysteresis value for upper limit can be adjusted between 0 and ctrr /20.This parameter can't be higher than (UPL 1 - LoL 1 - HYSL) value.

If SET key is pressed, it returns to parameter name.

By using ▼ and ▲ keys, delay time for higher limit alarm can be adjusted between 0 and 900 seconds.

If SET key is pressed, it returns to parameter name.

By using ▼ and ▲ keys, lower limit value can be adjusted between lower scale and upper scale that specified with ctrr parameter.This parameter can't be higher than (UPL 1 - HYSU - HYSL) value.

If SET key is pressed, it returns to parameter name.

By using ▼ and ▲ keys, hysteresis value for upper limit can be adjusted between 0 and ctrr /20.This parameter can't be higher than (UPL 1 - LoL 1 - Hys.U) value.

If SET key is pressed, it returns to parameter name.

By using ▼ and ▲ keys, delay time for lower limit alarm can be adjusted between 0 and 900 seconds.

If SET key is pressed, it returns to parameter name.

By using ▼ and ▲ keys, alarm output state can be adjusted to no. or nc. If it is adjusted to no output relay is powered at alarm condition.

If SET key is pressed, it returns to parameter name.

By using ▼ and ▲ keys, current transforming rate can be adjusted between 5.00(/5) and 9999(/5).If this parameter changes, upper limit value is set to maximum scale ,minimum limit value is set to minimum scale and hysteresis values are set to 0.

If SET key is pressed, it returns to parameter name.

By using ▼ and ▲ keys, measuring type can be adjusted to Ac , dc or Acdc.Three leds at the top of the display show measuring type.

If SET key is pressed,it returns to parameter name.

By using ▼ and ▲ keys decimal point state can be adjusted according to value of the ctrr parameter. If ctrr parameter is lower than 10, measured value can be shown (0.00) or (0.0), If it is between 10 and 100 measured value can be shown (0.0) or (0)If it is higher than 100, measured value can be shown (0).

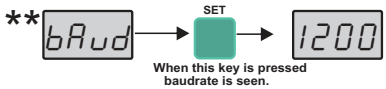
If SET key is pressed, it returns to parameter name.

Sampling time of the measurement value is shown on the screen. If the 1 selected;sampling time of the measurement is 250ms, If 2 is selected,it is 500ms.If 3 is selected, it is 750ms.If 1 is selected,it is 1 second.

If key SET is pressed, it returns to parameter name.

By using ▼ and ▲ keys, address of the device can be adjusted between 1-247.

If SET key is pressed, it returns to parameter name.



By using ▼ and ▲ keys, baudrate value of the device can be adjusted to OFF,1200,2400,4800,9600,19200.

If SET key is pressed,it returns to parameter name.

(*) There are only ctrr.,tYPE,dPnt and oPtn parameters in the devices those have no relay.
(**)The AdrS and bAud parameters are only in the devices those have modbus.
If any key is pressed in 25 seconds or the device is powered down and powered ups,then it returns to operation mode.

NOTE: If ▼ key is held down while the device is powered up, the dPAr message will appear and the factory settings will be restored.

ERROR MESSAGES

Means, measured current value is higher than maximum scale.

Means, measured current value is lower than minimum scale.
